Joseph Sarwuan Tarka University, Makurdi

Abstract

This study investigated Teachers' Perception of Influence of Insecurity on Public Primary School Pupils' Enrollment in Conflict-affected communities of Benue State, Nigeria. Two research questions were raised to guide the study and two hypotheses were formulated and at tested at 0.05 level of significance. The study employed a descriptive survey design. The population of the study was 3910 teachers in thirty- eight public primary schools in Benue State. A sample of 363 teachers was selected using Taro Yamane (1967) sample size determination. The study adopted multi-stage sampling techniques; purposive, proportional and simple random sampling techniques to select 363 teachers in public primary schools in Makurdi, Guma, Gwer-West, Logo, Ukum, Kwande, Agatu and Otukpo Local Government Areas of Benue State. Data for the study was collected from researcher's self-made questionnaire titled: Teachers' Perception of Influence of Insecurity questionnaire (TPIIQ). Descriptive statistics; Mean and Standard Deviations were employed to answer research questions while Chi-Square test of independence was used to test the hypotheses at 0.05 level of significance. The findings indicate teachers perceive that the constant threat of attacks, raids, kidnappings, or communal clashes creates a climate of fear that prevents parents from sending children to school and teachers perceived that physical insecurity often leads to the closure of schools in high-risk areas. When families flee to Internally Displaced Persons (IDP) camps, pupils lose access to their primary learning environments. It is recommended that to combat socio-economic insecurity, the school feeding program should be expanded to include a Take-Home Ration for the most vulnerable families. If a child maintains a high attendance rate, the

family receives a dry-food pack (grains/oil) at the end of the month, turning the child into an economic asset through education rather than labour. Again, that for pupils currently in IDP camps, the Ministry of Education should deploy temporary learning centers to ensure education continues despite displacement. The study concludes that, teachers in conflict-affected communities of Benue State perceive insecurity in its multiple dimensions; social, physical, emotional, psychological, environmental, and socio-economic as a critical barrier to public primary school pupils' enrollment

Keywords: Teachers' perception, insecurity, enrollment, physical insecurity, socio-economic insecurity

Introduction

Education is universally recognized as a fundamental human right and a critical foundation for individual development and national progress in every sector. The right of every child to receive quality and uninterrupted education is enshrined in various international frameworks, not limited to United Nations Convention on the Rights of the Child (UNCRC, 1989) and the Sustainable Development Goal 4 (SDG 4), which emphasizes inclusive and equitable quality education for all (UNESCO, 2021). Primary education is the foundational level of schooling designed to provide learners who are called pupils with basic literacy, numeracy, and life skills that form the basis for further learning and personal development (World Bank, 2022; Ogundele & Aina, 2020).

It is pertinent to note that, goals of primary education have been hampered by the prevailing state of insecurity in Nigeria at large and Benue State in particular. The achievement of the core objectives of primary education in Benue State, Nigeria is jeopardized in many conflict-affected communities.

Insecurity refers to a state where citizenry experience instability, fear, or uncertainty arising from the absence or breakdown of safety, protection, or order within a society. It encompasses a wide range of threats including physical violence, armed conflict, terrorism, banditry, kidnapping, and communal clashes, all of which disrupt social, economic, and educational activities. In the context of education, insecurity becomes particularly concerning when it affects vulnerable populations such as children, whose right to access safe, quality learning environments is undermined. According to Okolie and Udeh (2021), insecurity is a multidimensional problem that affects not only the physical safety of individuals but also erodes public confidence in institutions and prevents national development. This study notes that perceive influence of physical and socio-economic insecurities on pupils' enrollment.

The physical insecurity has been defined by various scholars. Physical insecurity, according to Okeke and Obasi (2022) is the condition in which people constantly dread physical damage, death, or property destruction as a result of the state's inadequate security. In another perspective to the concept of physical insecurity, Adebayo and Ibrahim (2023) opined that it is ongoing exposure of communities to violent threats like banditry, insurgency, and intercommunal conflicts, which obstructs development and access to public services like healthcare and education.

In places affected by conflict, low enrollment rates are also significantly influenced by physical insecurity, which includes violence, attacks, and the damage of school infrastructure. Physical attacks on teachers and educational facilities in crisis areas deter parents and students from attending formal education, according to Okon and Adeyemo (2022). Not only physical attacks affect pupils and learners which may create an influence on school enrollment, socio-economic insecurity may have its influence.

In the words of Ibrahim (2023) socio-economic insecurity as the incapacity of people or households to meet fundamental social and economic demands as a result of inflation, unemployment, inadequate infrastructure, and a lack of institutional assistance. Low enrollment rates in places affected by violence are largely caused by socioeconomic instability, which includes poverty, loss of parental income, and child labor. According to Adebayo (2023), conflict-related economic hardship compels many families to prioritize satisfying their fundamental survival needs above their children's education. Many parents in Benue State cannot afford school fees, uniforms, and other educational supplies, particularly those who have lost their jobs as a result of the fighting. In some cases, children are withdrawn from school and forced to work to supplement household income. This economic strain on families severely limits the ability of children to enroll in school or continue their education. The cost of education in conflict areas deters many parents from making education a priority, which greatly contributes to the low enrollment rates in these areas (Musa et al., 2024).

Terhemba and Ochoga (2020) carried out a study in Makurdi, Benue State, titled Economic Displacement and the Enrollment of Children in Public Schools. The main objective was to assess how the loss of ancestral farmlands affects the ability of parents to afford schooling. The study used a correlational design with 2 research questions and no hypotheses. The population comprised 500 displaced parents, with a sample size of 150. A semi-structured interview schedule served as the instrument, and data were analyzed via Qualitative Content Analysis. This study relates to the present work by focusing on the socio-economic variables within the same geographical context of Benue. The findings indicated that the destruction of livelihoods is a more significant driver of non-enrollment than physical fear itself. The gap is evident as

Terhemba and Ochoga used a qualitative approach and a small sample of parents, while the present study uses a quantitative approach exploring 38 public primary schools with a study population of 3910 teachers and sample size of 363 teachers and incorporates hypotheses testing via Chi-square test of independence.

Dung and Pam (2023) explored "Socio-Economic Shocks and Primary Education Participation" in conflict zones in Plateau State. The main objective was to find the influence of household poverty levels on school re-entry after communal clashes. The study employed a survey design with 5 research questions and 5 hypotheses. The population was 2,100 teachers, and the sample was 400. Data were collected through a Questionnaire on Socio-Economic Insecurity (QSEI) and analyzed using Multiple Regression Analysis. This work relates to the present study in its focus on the economic aftermath of conflict on education. The findings showed that the inability to provide uniforms and mid-day meals due to economic shocks led to massive enrollment

withdrawals. The gap lies in the complexity of the variables; Dung and Pam used 5 hypotheses and regression analysis, whereas the present work streamlines the focus into 2 objectives, 2 research questions and 2 hypotheses, specifically applying Chi-square to determine the independence of the variables. Again, the present study explored 38 public primary schools with a study population of 3910 teachers and sample size of 363.

Abba and Kyari (2021) investigated how physical threats dictate educational participation in North-Eastern Nigeria. "Impact of Insurgency on Primary School Enrollment in Borno State". The main objective was to determine the correlation between school attacks and dropout rates. The study adopted a descriptive survey design and utilized 3 research questions and 2 hypotheses. The population consisted of 1,200 teachers across 15 schools, with a sample size of 300 determined through simple random sampling. Data were gathered using a structured questionnaire and analyzed using Pearson Product Moment Correlation (PPMC). This work relates to the present study as both examine how physical danger serves as a barrier to schooling. The findings revealed that physical insecurity leads to a 40% decline in new enrollments due to fear of abduction. However, the difference (gap) lies in the scope and analysis; while Abba and Kyari focused on Borno State using PPMC, the present work focuses on Benue State. The present has two objectives, 2 questions and 2 hypotheses and has utilizes a larger population of 3,910 teachers, 363 sample size and employs Chi-square tests of independence to analyze the data.

Adamu (2022) conducted a research project in Kaduna State titled "Physical Security and the Accessibility of Basic Education in Volatile Communities." The main objective was to evaluate how the absence of perimeter fencing affects parental confidence in school safety. The study utilized an ex-post facto research design with 4 research questions and 2 hypotheses. The population included 850 headteachers and parents, with a sample of 250 participants. The instrument was a researcher-designed rating scale, and data were analyzed using t-tests. This work is relevant because it highlights the physical environment's role in enrollment trends. The findings showed that schools without visible security presence saw a 60% decrease in enrollment during conflict periods. The gap in this study is that it utilized an ex-post facto design and a mixed population of parents and teachers, whereas the present work only used teachers as respondents strictly utilizes a survey design focusing on 3,910 teachers, 363 sample size and uses Mean and Standard Deviation for descriptive analysis to answer research questions as well as chi-square for testing its hypotheses.

Many scholars have written on insecurity and school enrollment. However, the gaps are noted in content and methodology. Previous works mostly used single index of insecurity. Again, many previous works explored other statistical tools for data analysis such as T-test, Pearson Product Movement correlation, or ex-post facto. The present study bridged the gap by exploring insecurity considering two perspectives of physical and economic insecurity aimed to find out teachers' perceptions of influence of insecurity on public primary school pupils' enrollment in conflict affected communities of Benue State

Statement of the Problem

The primary education system in Nigeria is designed to provide development of the individual into a morally sound, patriotic and effective citizen, total integration of the individual into the immediate community, the Nigerian society and the world, provision of equal access to qualitative educational opportunities for all citizens at all levels of education within and outside the formal school system, inculcation of national consciousness, values and national unity and development of appropriate skills, mental, physical and social abilities and competencies to empower the individual to live in and contribute positively to the society.

In realization of these objectives; security is a major key. However, this realization has been hampered in some areas of the country in which Benue State is not exempted. This insecurity as witnessed by researcher and supported earlier by Okon and Adeyemo (2022) has led to social, physical, emotional, psychological, environmental and socio-economic insecurity which robbed the areas of the goals of National Policy on Education (NPE). Insecurity may have far-reaching implications on the achievement of primary education objectives in conflict-affected communities. Social insecurity erodes peer interaction and teamwork, thereby weakening character formation and moral training. Physical insecurity disrupts regular school attendance, which hinders the inculcation of permanent literacy and numeracy skills. Emotional insecurity generates fear and withdrawal, obstructing communication skill development and reflective thinking. Psychological insecurity, often manifested through trauma and stress, undermines concentration required for effective learning. Environmental insecurity displaces families and children, cutting them off from stable schooling needed for scientific and reflective foundations. Similarly, socio-economic insecurity forces pupils into child labor, depriving them of opportunities to develop life and manipulative skills necessary for societal functioning.

The implication of insecurity on education which might affect the enrollment will influence the fundamental right and a critical foundation of learning. However, these goals are susceptible to several influencing factors, among which insecurity might stand out as a critical barrier, particularly in conflict-prone regions. In Benue State, the growing wave of insecurity characterized by armed attacks, communal clashes, herder-farmer conflicts, kidnappings, and displacement has become a persistent threat to the education of children in rural and vulnerable communities. Numerous primary schools in conflict-affected areas have been destroyed or shut down due to safety concerns, while many families have been forced to flee their homes, resulting in the displacement of school-aged children. As a result, a large number of children are either unable to enroll in school or have dropped out due to the insecurity that surrounds their environment. Reports have shown that entire communities in areas such as Guma, Makurdi, Gwer-West, Logo, Ukum, Kwande, Agatu, Otukpo among other Local Government Areas of Benue State have been deserted, leading to the closure or abandonment of primary schools in those locations.

This poses a serious implication to the achievement of the goals of primary education in Benue State. When children are denied access to education due to insecurity, the foundational objectives of literacy development, civic education, and social integration are severely undermined. The loss of learning opportunities not only affects individual children but also jeopardizes the long-term development of affected communities and the state at large. Against this

backdrop, this study intends to investigate teachers' perception of influence of insecurity on public primary school pupils' enrolment in conflict-affected communities of Benue State.

Objectives of the study

The purpose of this study is to investigate Teachers' Perception of Influence of Insecurity on Public Primary School Pupils' Enrollment in Conflict-affected communities of Benue State, Nigeria. Specifically, the study seeks to:

- i. find out teachers' perception of influence of physical insecurity on public primary school pupils' enrollment in conflict-affected communities of Benue State.
- ii. find out teachers' perception of influence of socio-economic insecurity on public primary school pupils' enrollment in conflict-affected communities of Benue State

Research Questions

The following questions are raised;

- i. What is the teacher's perception of influence of physical insecurity on public primary school pupils' enrollment in conflict-affected communities of Benue State?
- ii. What is the teacher's perception of influence of socio-economic insecurity on public primary school pupils' enrollment in conflict-affected communities of Benue State?

Hypotheses

The following hypotheses were formulated and tested at 0.05 level of significance

- i. Teachers' perception of physical insecurity does not significantly influence public primary school pupils' enrollment in conflict-affected communities of Benue State.
- ii. Teachers' perception of socio-economic insecurity does not significantly influence public primary school pupils' enrollment in conflict-affected communities of Benue State.

Methodology

The study adopted descriptive survey design. The population of the study is 3910 teachers from 38 public primary schools in Benue State. (SUBEB, 2024). The sample size for the study is 363 teachers determined using Yamane (1967) sample size technique. The study adopted multi-stage sampling technique. Firstly, purposive sampling technique was used to select 38 public primary schools from 8 local government areas of Benue State. Secondly, proportional sampling was used to ensure that different subgroups (public primary schools and teachers in zones A, B and C) within a population are represented in the sample according to their actual proportions, thereby improving the representativeness of the study. Consequently, 159 teachers were selected from 15 public primary schools in Zone A, 113 teachers were drawn from 13 public primary schools in Zone B, and 91 teachers were selected from 10 public primary schools in Zone C. This proportional allocation ensured that the sample accurately reflected the teacher population across the three zones, accounting for differences in school sizes and teacher distributions. Thirdly,

simple random sampling which was used to give every member of the population an equal chance of selection, which helps to reduce bias and enhance the generalizability of the findings.

The instrument for data collection is questionnaire titled ‘Teachers’ Perception of Influence of Insecurity on Public Primary School Pupils’ Enrollment in Conflict-affected communities of Benue State, Nigeria questionnaire (TPIIQ) is a four-point rating scale instrument structured in clusters with response options of High Influence (HI) = 4, Influence (I) = 3, Low Influence (LI) = 2, No Influence (NI) 1. The structured questionnaire was developed by the researcher and is validated by three experts; one from the Department of Measurement and Evaluation, two from the Department of Educational Administration and Planning, all from College of Education, Joseph Sarwuan Tarka University, Makurdi. The corrections offered by the experts are considered. The reliability of the instrument was confirmed using Cronbach's Alpha. The result of the internal reliability of 0.95 was ascertained indicating that the instrument was reliable for the study. Data from completed instrument was analyzed using descriptive statistic; mean and standard deviation to answer the research questions. Mean rating which falls within and above 2.50 is accepted while mean rating below 2.50 is rejected. While non-parametric statistic Chi-Square test of independence was used to test the hypotheses of 0.05 alpha level of significance. Chi-square test helps researchers examine whether the distribution of one variable differs depending on the categories of another variable. The study is anchored on two theories; Ecological Systems theory by Bronfenbrenner (1979) and Conflict Theory by Karl Marx (1848)

Results:

Research Question 1: What is the teacher’s perception of influence of physical insecurity on public primary school pupils’ enrollment in conflict-affected communities of Benue State?

Table 1: Mean and Standard Deviation of Teachers’ Perception of Influence of Physical Insecurity on Public primary Schools Pupils’ enrollment in Conflict-affected Communities of Benue State, Nigeria

S/N	ITEMS	$\bar{x}$	SD	Decision
-----	-------	-----------	----	----------

1. What is the influence of armed attacks on enrollment of public

primary school pupils in conflict-affected communities of Benue State?	3.31	0.46	Influence
2. What is the influence of destruction of school buildings on enrollment of public primary school pupils in conflict-affected communities of Benue State?	3.71	0.46	High Influence
2. What is the influence of presence of armed groups around schools on enrollment of public primary school pupils in conflict-affected communities Benue State?	3.56	0.50	High Influence
3. What is the influence of abduction or kidnapping threats on enrollment of public primary school pupils in conflict-affected communities of Benue State?	3.71	0.46	High Influence
1. What is the influence of physical assault on pupils on enrollment of public primary school pupils in conflict-affected communities of Benue State?	3.90	0.30	High Influence
6. What is the influence of insecurity of school premises on enrollment of public primary school pupils in conflict-affected communities of Benue State?	3.49	0.50	Influence
7. What is the influence of destruction of learning materials on enrollment of public primary school pupils in conflict-affected communities of Benue State?	3.00	0.50	Influence
Grand mean	2.97	0.45	Influence

The results in Table 1 show that teachers perceive physical insecurity as having a notable influence on public primary school pupils' enrollment in conflict-affected communities of Benue State. Although the overall grand mean of 2.97 with a standard deviation of 0.38 falls within the "Influence" (I) category, indicating a significant but not extremely high level of perceived influence, several specific indicators recorded very high mean scores. Physical assault on pupils ($\bar{x} = 3.90$, $SD = 0.30$), destruction of school buildings ($\bar{x} = 3.71$, $SD = 0.46$), the presence of armed groups around schools ($\bar{x} = 3.56$, $SD = 0.50$), and threats of abduction or kidnapping ($\bar{x} = 3.71$, $SD = 0.46$) were all rated as having high influence, suggesting that direct threats to pupils' safety strongly discourage school enrollment. In contrast, factors such as armed attacks ($\bar{x} = 3.31$, $SD = 0.46$), insecurity of school premises ($\bar{x} = 3.49$, $SD = 0.50$), and destruction of learning materials ($\bar{x} = 3.00$, $SD = 0.00$) were perceived as influential but to a lesser degree.

The results indicate that while teachers view physical insecurity in general as significantly affecting enrollment, particular security threats, especially those endangering children's physical safety are regarded as major deterrents to school enrollment in conflict-affected areas of Benue

State. This aligns with Karl Marx (1848) Conflict Theory which posited that society is fundamentally structured and the rising tensions from struggles over limited resources, such as wealth, land, and power breed. Insecurity. Insecurity in regions like Benue State can be understood as a manifestation of such struggles, often leading to violence, displacement, and disruptions in public services, including education.

Research Question 2: What is the teacher's perception of influence of socio-economic insecurity on public primary school pupils' enrollment in conflict-affected communities of Benue State?

Table 2: Mean and Standard Deviation of Teachers' Perception of Influence of Socio-economic Insecurity on Public primary Schools Pupils' enrollment in Conflict-affected Communities of Benue State, Nigeria

S/N	ITEMS	X	SD	Decision
1.	What is the influence of loss of family income due to insecurity on enrollment of public primary school pupils in conflict affected communities of Benue State?	3.71	0.46	High Influence
2.	What is the influence of high cost of living due to insecurity on enrollment of public primary school pupils in conflict-affected communities of Benue State?	3.76	0.43	High Influence
3.	What is the influence of loss of economic opportunities in conflict-affected areas on enrollment of public primary school pupils in conflict-affected communities of Benue State?	3.76	0.43	High Influence
4.	What is the influence of financial hardship among displaced families on enrollment of public primary school pupils in conflict-affected communities of Benue State?	3.29	0.46	Influence
5.	What is the influence of lack of educational resources due to insecurity on enrollment of public primary school pupils in conflict-affected communities of Benue State?	3.95	0.22	High Influence
6.	What is the influence of unemployment of parents caused by insecurity on enrollment of public primary school pupils in conflict-affected communities of Benue State?	3.80	0.40	High Influence
7.	What is the influence of poverty among parents on enrollment of public primary school pupils in conflict-affected communities of Benue State?	3.75	0.43	High Influence
Grand Mean		3.72	0.40	High Influence

The results in Table 2 indicate that teachers perceive socio-economic insecurity as having a high influence on the enrollment of public primary school pupils in conflict-affected communities of Benue State. This conclusion is supported by the grand mean of 3.72 with a

standard deviation of 0.40, which clearly falls within the High Influence (HI) category. Almost all the socio-economic indicators were rated very highly, suggesting that economic instability and financial constraints play a major role in reducing school enrollment in conflict-prone environments. Teachers strongly believe that factors such as loss of family income due to insecurity ($\bar{x} = 3.71$, SD = 0.46), high cost of living ($\bar{x} = 3.76$, SD = 0.43), loss of economic opportunities in conflict-affected areas ($\bar{x} = 3.76$, SD = 0.43), lack of educational resources ($\bar{x} = 3.95$, SD = 0.22), unemployment of parents ($\bar{x} = 3.80$, SD = 0.40), and poverty among parents ($\bar{x} = 3.75$, SD = 0.43) significantly undermine parents' ability to enroll their children in school. Although financial hardship among displaced families ($\bar{x} = 3.29$, SD = 0.46) was rated slightly lower, it still indicates a meaningful level of influence.

These result show that socio-economic insecurity, particularly reduced household income, increased living expenses, limited job opportunities, and lack of essential educational materials, is perceived by teachers as a major barrier to sustained school enrollment in conflict-affected communities of Benue State. The result agrees with Ecological Systems theory by Bronfenbrenner (1979) which identifies five interrelated layers of systems. At the microsystem level or layer explains how insecurity disrupts the immediate environment in which a child interacts wher safety and stability of families, schools, and communities are threatened by the ongoing conflict, such as attacks on schools or forced displacements, which directly impact children's ability to attend school.

Research Hypothesis 1: Teachers' perception of physical insecurity does not significantly influence public primary school pupils' enrollment in conflict-affected communities of Benue State.

Table 3: Chi-Square Analysis of Teachers' Perception of Influence Physical Insecurity on Primary School Pupils' Enrolment

Item	df	χ^2	Asymp.Sig
Chi-square	3	70.231 ^a	0.000
No. of valid case	7		

Table 4 shows the chi-square result assessing the teachers' perception of physical insecurity and pupils' enrollment in conflict-affected communities. The chi-square value is $\chi^2 = 70.231$ with 6 degrees of freedom, and the corresponding p-value is 0.000. Since the p-value is less than the 0.05 threshold for statistical significance, the null hypothesis is rejected. This indicates that teachers' perception of physical insecurity has a significant influence on the enrollment of public primary school pupils in conflict-affected communities of Benue State.

Research Hypothesis 2: Teachers' perception of socio-economic insecurity does not significantly influence public primary school pupils' enrollment in conflict-affected communities of Benue State.

Table 4: Chi-Square Analysis of Teachers' Perception of Influence Socio-Economic Insecurity on Primary School Pupils' Enrolment

Item	df	χ^2	Asymp.Sig
Chi-square	3	130.939 ^a	0.000
No. of valid case	7		

Table 4 presents the Chi-square analysis of teachers' perception of socio-economic insecurity and pupils' enrollment in conflict-affected communities. The result shows a Chi-square value of $\chi^2 = 130.939$, with 6 degrees of freedom, and an associated p-value (Asymp. Sig.) of 0.000. Since the p-value is less than the 0.05 level of significance, the null hypothesis is rejected. This indicates that teachers' perception of socio-economic insecurity including loss of family income, poverty, unemployment, high cost of living, financial hardship, and lack of educational resources significantly influences public primary school pupils' enrollment in conflict-affected communities of Benue State.

Discussions of Findings

The first finding revealed teachers view physical insecurity in general as significantly influencing enrollment, particular security threats, especially those endangering children's physical safety are regarded as major deterrents to school enrollment in conflict-affected areas of Benue State. This implies that, where schools are destroyed, people are killed and displaced it will negatively influence enrollment of primary school pupils in conflict-affected communities. This finding is in agreement with the work of Adamu (2022) who found that schools without visible security presence saw a 60% decrease in enrollment during conflict periods. And Abba and Kyari (2021) whose study findings revealed that physical insecurity leads to a 40% decline in new enrollments due to fear of abduction

Second finding revealed that, that economic constraints directly affect parents' ability and willingness to enroll their children in school, making socio-economic insecurity a major barrier to educational participation in these areas. This implies that socio-economic insecurity shapes parents' and pupils' decision regarding enrollment. This finding is consistent or aligns with the study of Dung and Pam (2023) which showed that the inability to provide uniforms and mid-day meals due to economic shocks led to massive enrollment withdrawals. And Terhemba and Ochoga (2020) study which found out that the destruction of livelihoods is a more significant driver of non-enrollment than physical fear itself.

Conclusion

Based on the findings of this study, the researcher concluded that insecurity which explains threats to safety be it physical or socio-economic in nature has greatly influences pupils' enrollment in conflict-affected communities of Benue State, Nigeria. As insecurity persist, lack of pupils' enrollment in schools is certain thereby hindering their right to basic education.

Recommendations

- 1.Provision of adequate security in conflict-affected communities in Benue State should be done as well as rebuilding of public primary schools destroyed.
- 2.Government should provide financial supports for families affected in those conflicts to restart life and a meaningful life with capacity to enroll their children in school.
