HARNESSING SIGNAL INTELLIGENCE FOR EFFECTIVE SCHOOL ADMINISTRATION: IMPLICATIONS FOR THE ADMINISTRATION OF PUBLIC PRIMARY SCHOOLS IN BENUE STATE, NIGERIA

OKINO Momoh Hajara

Department of Educational Administration and Planning,
Joseph Sarwuan Tarka University, Makurdi, Benue State, Nigeria

Abstract

The integration of technology into educational administration has become indispensable in contemporary school administration, particularly in conflict-prone environments where safety and accountability are paramount. Therefore, this study examined harnessing signal intelligence for effective school administration and its implications for the administration of public primary schools in Benue State, Nigeria. The study specifically investigated how information from tracking devices contributes to intelligence gathering that minimizes crime activities in public primary schools and examined the role of aerial surveillance technologies in enhancing school safety. The study adopted a descriptive survey research design. The population consisted of 9,436 teachers in 2,779 public primary schools in Benue State, while a sample of 369 teachers was selected using Glenn's sample size determination formula and a multi stage sampling technique. Data were collected using a structured questionnaire rated on a four-point rating scale. The instrument was validated by experts and tested for reliability using Cronbach's Alpha. Data were analyzed using Mean scores and Standard Deviation with the aid of SPSS. Findings revealed that tracking devices significantly contribute to intelligence gathering that minimizes crime activities in public primary schools by improving real time monitoring, early detection of suspicious movements, prevention of unauthorized access, and strengthening coordination with security agencies. The study also found that aerial surveillance technologies enhance school safety by improving wide area monitoring, supporting early threat detection, reducing blind spots, and improving emergency response. The study concludes that signal intelligence tools such as tracking devices and aerial surveillance systems are essential for improving school security and administrative effectiveness.

in Benue State. It was recommended that government and school authorities should adopt and integrate modern intelligence-based technologies into school security systems and train personnel for effective implementation.

Keywords: *Signal Intelligence, Security, School Governance, Administration, & Public Primary Schools*

Introduction

Security intelligence gathering has become an indispensable component of effective school administration, particularly in environments confronted with persistent security threats. In recent years, public primary schools in Benue State, Nigeria, have increasingly operated under conditions characterized by vandalism, kidnapping, trespass, violent attacks, and disruptions to academic activities. These threats have heightened concerns over the safety of pupils, teachers, administrators, and school infrastructure. The capacity of school administrators to anticipate danger, detect suspicious movements, and coordinate timely responses now depends largely on access to credible and actionable intelligence. This development has redirected attention toward technology driven security systems capable of strengthening school safety and improving administrative effectiveness. Security intelligence gathering therefore remains central to the administration of public primary schools, especially in regions facing security challenges where stable learning environments can no longer be taken for granted.

Signal intelligence refers to the collection, monitoring, and analysis of electronic signals and digital communications to detect threats, prevent crimes, and support security decisions. It includes the interception of phone calls, emails, radio transmissions, encrypted messages, GPS signals, and network activities for identifying suspicious behaviour and emerging risks (Olowonihi & Musa, 2024; Itoje-Akpokiniovo, 2022). In public primary schools, signal intelligence can help administrators and security agencies track threats in real time, protect sensitive records, detect crime patterns, and improve emergency response systems. It is therefore a modern intelligence tool for enhancing school safety and protecting pupils, staff, and infrastructure. School administration, on the other hand, refers to the process of planning, organizing, directing, coordinating, and controlling school resources to achieve educational goals effectively. It involves managing personnel, finances, facilities, policies, and academic programmes while creating a conducive environment for teaching and learning (Thungu et al., 2008; Kakanda, 2013). School administration also includes leadership, stakeholder engagement, policy implementation, and continuous supervision to ensure quality standards are maintained (Bush & Bell, 2002; Wango, 2010). In essence, it is the system through which schools are guided toward efficiency, order, and improved educational outcomes.

The administration of primary schools remains pivotal to institutional effectiveness and efficiency because administration involves the systematic planning, organization, coordination, and control of resources for the achievement of predetermined educational objectives. It serves as the backbone of every functional educational system by ensuring that school programmes, personnel,

finances, and facilities are properly managed. In the context of school administration, the ability to achieve educational goals depends greatly on the existence of a safe and conducive environment for teaching and learning. Where insecurity prevails, school managers are often forced to shift attention from instructional supervision and policy implementation to crisis management and emergency response. Schools located in unsafe areas also experience difficulty attracting and retaining qualified teachers (Oluyomi & Grace, 2016). Human Rights Watch (2016) reported that insecurity destroyed nearly 1,000 schools and displaced about 19,000 teachers across several states in Nigeria. The Education Needs Assessment further revealed that out of 260 school sites assessed, 28 percent had been damaged by bullets, shelling, or shrapnel, 20 percent had been deliberately set ablaze, 32 percent had been looted, and 29 percent had armed groups or military forces in close proximity between 2009 and 2015. It was also reported that over 910 schools had been destroyed while at least 1,500 schools were forced to close down. These realities underscore the severe consequences of insecurity for educational administration in Nigeria.

The situation in Benue State presents a particularly urgent concern. Reports from the Benue State Emergency Management Agency (2023) indicate that over 40 schools were closed as a result of armed invasions, while more than 5,000 deaths were recorded across 18 local government areas, thereby severely disrupting access to education. Okwori and Angenyi (2019) also found that conflicts between farmers and pastoralists significantly hindered infrastructure utilization and student enrolment in primary schools in Benue State. Similarly, Agaba (2024) emphasized the urgent need for implementing the Minimum Standards for Safe Schools, noting that insecurity has resulted in widespread school closures and reduced access to education, especially in conflict prone communities. These developments suggest that conventional school security measures may no longer be sufficient to guarantee safety in many parts of the state. As insecurity becomes more complex, administrators require smarter and more responsive systems capable of generating timely intelligence for preventive action.

Recent technological advancement has significantly transformed intelligence gathering and security management across the world. Goodison, Davis, and Jackson (2015) identified modern security technologies such as location monitoring devices, predictive analytics, digital surveillance cameras, crime mapping software, and signal intelligence systems as valuable tools for enhancing security operations. These technologies enable security personnel to monitor high risk areas, track suspicious movements, strategically deploy personnel, and process evidence efficiently. Within the school context, one critical innovation is the use of tracking devices. Information provided through tracking devices can help monitor movement patterns, trace stolen property, identify unauthorized presence within school premises, and generate intelligence that minimizes crime activities in public primary schools. Another important innovation is aerial surveillance technologies such as drones and remote monitoring systems. These tools provide wider visual coverage of school compounds, surrounding communities, access routes, and vulnerable boundary areas. They can detect unusual movements, monitor emerging threats, and improve coordination during emergencies. Signal intelligence, which involves monitoring electronic communications to detect threats, has also been recognized as useful in preventing school related crimes in high-risk

environments (Federal Ministry of Education, 2020). School administrators can collaborate with security agencies to utilize such intelligence for strengthening school safety protocols.

Studies have been conducted regarding this study area. Gbesoevi, Ola, and Simeom (2022), *Influence of Modern Technology on School Safety and Security Planning in Lagos State*, adopted a descriptive and correlational research design. The study sampled 1,470 respondents comprising 1,020 teachers and 450 principals from public secondary schools in Lagos State using disproportionate, simple random, and convenience sampling techniques. Data were collected through a self-designed questionnaire and analyzed using Pearson Product Moment Correlation Coefficient. The findings revealed a significant relationship between school security planning and effective management of public secondary schools, as well as significant correlations between school safety programmes, social environment safety, physical security measures, and effective school management. The study recommended structured safety and security planning supported by modern technology in schools.

Aballe et al. (2022), *Effectiveness of CCTV Installation in Crime Prevention in Philippine Community Schools*, employed a descriptive correlational research design. The population comprised 54 primary schools, while 858 primary six pupils were selected through stratified random sampling. A structured questionnaire was used for data collection, and Chi square served as the analytical tool. Findings showed that CCTV installations were highly effective in crime prevention through continuous monitoring and support for crime investigations. The study recommended wider installation of CCTV systems in schools to strengthen safety and surveillance. Katarapu, Reddy, and Rao (2023), *Use of GPS and GSM Based Tracking Devices in Schools*, utilized a quasi-experimental research design. The population consisted of secondary school students, with a purposive sample of 200 students selected from schools facing security challenges. Data were collected by comparing incidents before and after the introduction of tracking devices and analyzed using descriptive statistics. Findings indicated a significant reduction in kidnapping risks and unauthorized entry, while tracking signals provided administrators with useful intelligence for crime prevention. The study recommended the adoption of GPS and GSM tracking devices in schools to improve safety management.

Duff (2025), *Drone Surveillance in U.S. Campuses*, adopted a case study approach. The population included administrators and security officers, with 50 respondents selected through convenience sampling from institutions already using aerial surveillance systems. Data were obtained through observations of drone patrols and semi structured interviews, then analyzed using thematic analysis. Findings revealed that drones improved visibility, reduced blind spots, and enhanced rapid coordination with law enforcement agencies. The study recommended the integration of drone surveillance technologies into school security systems.

TAL Global (2026), *Anonymous Tip Lines and Digital Monitoring Systems in Schools*, used a descriptive survey design. The population comprised administrators and teachers, while 120 respondents were selected through stratified random sampling from urban and rural schools. Data were gathered through structured questionnaires and case reports, and analyzed using descriptive statistics and thematic coding. Findings showed that signal intelligence systems provided early

warning signals that enabled administrators to prevent threats before harm occurred. The study recommended the adoption of anonymous reporting systems and digital monitoring technologies for proactive school security.

Ezekiel, Ochoche, and Agbo (2024) examined the impact of digital security monitoring on administrative decision making in Benue State schools. The study employed a mixed methods research design. The population consisted of administrators, teachers, and security personnel, with a stratified random sample of 300 respondents selected from urban, semi urban, and rural schools. Data were collected through questionnaires and interviews, while Chi square and thematic analysis were used for analysis. Findings showed significant improvements in accountability and resource allocation, while administrators increasingly relied on factual intelligence for decision making. The study recommended wider deployment of digital monitoring systems in schools for better governance and security administration.

Kritz (2024) carried out a study on signals Intelligence and real time communication between institutions and security agencies, adopted documentary analysis and case study methods. The study purposively selected relevant security scenarios and used secondary data from institutional reports and communication logs. Data were analyzed through content analysis. Findings revealed reduced response times, stronger collaboration, and more effective communication between institutions and security agencies through signal intelligence systems. The study recommended strengthening intelligence sharing frameworks between schools and external security agencies for timely threat response.

The integration of technology-based intelligence gathering into school administration is therefore essential for safeguarding public primary schools in Benue State. Intelligence gathering serves as a proactive mechanism for protecting pupils, teachers, and school facilities while enabling administrators to focus on curriculum implementation, staff supervision, and learner welfare without being overwhelmed by security concerns. Effective school administration requires a secure environment in which educational activities can proceed without fear or disruption. Despite the growing relevance of tracking devices and aerial surveillance technologies, limited empirical attention has been given to how these tools can be harnessed specifically for the administration of public primary schools in Benue State. It is against this background that this study seeks to examine how information provided via tracking devices contributes to gathering intelligence that minimizes crime activities in public primary schools in Benue State, and to investigate the role of aerial surveillance technologies in enhancing the safety of public primary schools in the state.

Statement of the Problem

Effective school administration in public primary schools should be driven by timely, accurate, and actionable information. School leaders are expected to monitor staff attendance, pupil enrolment, learning outcomes, infrastructure needs, financial records, security conditions, and community feedback in a coordinated manner. When relevant signals from the school environment are properly identified, collected, interpreted, and applied, administrators can make faster and better decisions on teacher deployment, resource allocation, discipline, instructional supervision,

and emergency response. In an ideal system, signal intelligence supports transparency, accountability, early problem detection, and continuous improvement, thereby creating stable learning environments where pupils and teachers can perform effectively.

In many public primary schools in Benue State, this ideal situation appears weakened by administrative practices that rely heavily on delayed reports, manual record keeping, fragmented communication, and reactive decision making. Warning signs such as declining attendance, poor teacher punctuality, pupil dropout trends, insecurity threats, infrastructural decay, conflict within school communities, and weak academic performance are often not detected early or are not acted upon promptly. In some cases, administrators may lack the tools, skills, or systems needed to gather and analyze useful operational signals from both internal and external school environments. This weakens planning, slows response to emerging challenges, reduces accountability, and contributes to inefficiencies in the management of public primary schools.

The need for this study arises from the growing demand to modernize school administration and improve the performance of public primary schools in Benue State. As educational challenges become more complex, administrators require smarter approaches that enable evidence-based decisions and proactive management. Harnessing signal intelligence may provide practical solutions for tracking trends, identifying risks, improving communication, strengthening supervision, and enhancing service delivery in schools. However, there is limited clarity on how signal intelligence can be effectively applied within the context of public primary school administration in Benue State. This study therefore seeks to examine how signal intelligence can be harnessed for effective school administration and to determine its implications for the administration of public primary schools in the state.

Objectives of the Study

The main objective of the study is to examine the influence of signal intelligence gathering on the administration of public primary schools in Benue State. The specific objectives, however, include to:

1. **examine how information provided via tracking devices contributes to gathering intelligence that minimizes crime activities in public primary schools in Benue State.**
2. **investigate the role of aerial surveillance technologies, in enhancing the safety of public primary schools in Benue State.**

Research Questions

The following questions were raised to guide the study:

1. **What extent does information provided via tracking devices contributes to gathering intelligence that minimizes crime activities in public primary schools in Benue State?**
2. **What is the role of aerial surveillance technologies, in enhancing the safety of public primary schools in Benue State?**

Signal Intelligence Gathering and Schools Administration

School administration is responsible for implementing policies that foster a secure learning environment. The intersection of **SIGINT and school administration**, is significant in the realm of **security intelligence gathering**, where proactive measures are required to anticipate and mitigate risks (Nasiru & Olusegun, 2022). However, administrators face several challenges that hinder effective school management, particularly in the realm of cybersecurity and intelligence gathering. Schools are increasingly vulnerable to **cyber threats, unauthorized access, and digital espionage**, necessitating **strong cybersecurity frameworks** (Itoje-Akpokiniovo, 2022). These threats can compromise sensitive student data, disrupt learning environments, and expose institutions to financial and reputational risks.

Many schools struggle with **inadequate funding**, which affects their ability to **implement cybersecurity infrastructure and mobilize personnel** (Olowonihi & Musa, 2024). Budget constraints often result in **insufficient security measures**, leaving schools vulnerable to cyber threats. Administrators often struggle with **enforcing cybersecurity policies** due to **bureaucratic constraints, lack of coordination, and resistance from stakeholders** (Nasiru & Olusegun, 2022). Security policies must be **clear, adaptable, and effectively communicated** to ensure compliance.

SIGINT and school administration play a vital role in **security intelligence gathering**, ensuring that schools remain **safe, well-managed, and responsive to emerging threats** (Olowonihi & Musa, 2024). Security intelligence gathering helps schools determine **where and how SIGINT-based security measures should be implemented** (Nasiru & Olusegun, 2022). Administrators collaborate with **law enforcement agencies** to ensure that cybersecurity initiatives are **strategically positioned to monitor high-risk areas** (Itoje-Akpokiniovo, 2022).

SIGINT systems **monitor school networks**, using **firewalls, intrusion detection systems, and AI-powered analytics** to detect cyber threats (Olowonihi & Musa, 2024). Schools rely on **security intelligence data** to **adjust cybersecurity protocols** based on emerging threats (Nasiru & Olusegun, 2022). Schools engage **parents, local leaders, and cybersecurity experts** in intelligence-sharing initiatives (Itoje-Akpokiniovo, 2022). SIGINT provides **real-time data** that supports **school-driven security strategies** (Olowonihi & Musa, 2024). Administrators use **security intelligence data** to formulate policies on **student data protection, cybersecurity awareness, and digital safety** (Nasiru & Olusegun, 2022). SIGINT ensures that school security policies remain **adaptive and evidence-based** (Itoje-Akpokiniovo, 2022). Through **advanced cybersecurity technologies, intelligence-sharing networks, and data-driven decision-making**, schools can **enhance security intelligence gathering, prevent cyber threats, and create a secure learning environment**.

Methodology

This study employed a **descriptive survey design**, selected because it provides the most appropriate framework for examining how community-based intelligence gathering intersects with the administration of public primary schools in Benue State. The design made it possible to collect

data systematically from a representative sample, thereby offering a comprehensive picture of prevailing practices, conditions, and challenges in school governance within conflict-prone environments. By adopting this approach, the research was able to capture the lived realities of teachers who are directly engaged in both intelligence gathering and school administration.

The **population of the study** encompassed all public primary schools in Benue State. According to the State Universal Basic Education Board (SUBEB, 2023/2024), this population includes 9,436 teachers spread across 2,779 schools in the state's twenty-three Local Government Areas. Teachers were chosen as the focal respondents because they are central to the administration of schools and play a vital role in intelligence gathering, given their daily interactions with pupils, parents, and community members. From this population, a **sample of 369 teachers** was determined using Glenn's (2012) formula for sample size calculation, ensuring that the study remained both manageable and statistically representative.

A multi stage sampling design was used for the study. During the first stage, purposive sampling was adopted to choose five Local Government Areas (LGAs) in Benue State: Makurdi, Guma, Logo, Katsina Ala, and Agatu. These LGAs were purposely selected because they have witnessed higher level of insecurity and school administration problems, and therefore became the focus of the study. In the second stage, names of the public primary schools in each LGA were obtained from the education office of each LGA. A total of three schools in each LGA were selected by simple random sampling, where all the eligible schools in each LGA were given numbers, and the three schools needed to be drawn by ballot. This resulted in the selection of 15 schools, where each school had an equal opportunity of being selected.

In the third stage, the questionnaire was distributed to the fifteen schools through disproportionate stratified random sampling. The researchers subdivided respondents within each school into appropriate strata, such as head teachers, assistant head teachers and class teachers. Then, a predetermined number of questionnaires was distributed to each school and respondent category, with the aim of achieving an adequate representation of all the schools and respondent categories, rather than proportional representation of the total number of staff members in each school. This guaranteed representation of smaller schools, and prevented over-representation of large schools. The researcher and assistants visited each selected school to administer the questionnaires, with the assistance of the school administrators to coordinate with the respondents.

In the last step, the respondents from each stratum were selected using simple random sampling. A list of the names of eligible teachers or administrators in each school was obtained from the staff list and respondents were selected through balloting or random number selection to ensure an equal chance of inclusion. All the selected respondents were sent a questionnaire, accompanied by instructions for completion. The researcher collected the completed questionnaires on specified dates following up with the schools. This ensured the selection was fair, representative of the schools sampled and had a good response rate.

Data were gathered using a **structured questionnaire**. The instrument was constructed on a four-point Likert scale ranging from *Strongly Agree* to *Strongly Disagree*. To guarantee validity, the questionnaire was reviewed by experts in educational administration and security studies.

Reliability was tested using Cronbach's Alpha, which produced a coefficient of 0.88, confirming that the instrument was highly consistent and dependable.

The data collected were analyzed using both **descriptive and inferential statistics**. Frequencies, percentages, means, and standard deviations were employed to summarize responses and provide insights into the research objectives. The Statistical Package for Social Sciences (SPSS) was used for data analysis, which offered a robust platform for ensuring accuracy and clarity in the analysis.

Results

A total of 369 copies of the questionnaire were administered to the respondents in the study area. However, only 341 were retrieved, which constitute a return rate of 92.41%. The analysis of data was done on the copies of the retrieved questionnaire.

Question one: What extent does information provided via tracking devices contributes to gathering intelligence that minimizes crime activities in public primary schools in Benue State?

Table 1: Mean Scores and Standard Deviation of Influence of Signal Intelligence Gathering on Public Primary Schools Administration

S/N.	Items Description	N	SD	D	A	SA	$\bar{X}$	SD	Decision
1.	Tracking devices improve real time monitoring of school environments.	341	66	73	107	95	2.68	1.08	Agree
2.	Tracking information supports early detection of suspicious movements.	341	42	44	137	118	2.97	0.98	Agree
3.	Tracking systems help identify and prevent unauthorized access to school premises.	341	21	138	131	51	2.62	0.81	Agree
4.	Data from tracking devices strengthens coordination with security agencies.	341	30	97	193	21	2.60	0.74	Agree
5.	Tracking based intelligence reduces incidents of theft, vandalism, and intrusion in schools.	341	46	55	141	99	2.86	0.99	Agree
Cluster mean/SD							2.75	0.92	Positive

The results in Table 1 show respondents' perceptions on how information provided via tracking devices contributes to intelligence gathering that minimizes crime in public primary schools in Benue State. All the items recorded mean scores ranging from 2.60 to 2.97, which are above the benchmark for agreement. This indicates that respondents generally agree that tracking devices play a significant role in school security management. The highest mean score of 2.97 shows that tracking information strongly supports early detection of suspicious movements, while the lowest mean of 2.60 still reflects agreement that tracking data strengthens coordination with security agencies. The cluster mean of 2.75 with a standard deviation of 0.92 confirms a positive overall perception. This implies that tracking devices are widely recognized as effective tools for improving real time monitoring, preventing unauthorized access, and reducing incidents of theft, vandalism, and intrusion in schools.

Question Two: What is the role of aerial surveillance technologies, in enhancing the safety of public primary schools in Benue State?

Table 2: Mean Scores and Standard Deviation of the Responses of Respondents on Aerial surveillance technologies and school safety

S/N.	Items Description	N	SD	D	A	SA	$\bar{X}$	SD	Decision
1.	Aerial surveillance improves wide area monitoring of school surroundings.	341	61	90	132	58	2.55	0.97	Agree
2.	Drone based observation enhances early identification of security threats.	341	34	64	115	128	2.99	0.98	Agree
3.	Aerial systems support rapid response to emergencies in schools.	341	43	65	125	108	2.87	1.00	Agree
4.	Surveillance from above reduces blind spots in school security coverage.	341	78	29	147	87	2.71	1.08	Agree
5.	Aerial intelligence strengthens overall safety management in public primary schools.	341	72	32	154	83	2.73	1.05	Agree

Cluster mean/SD	2.77	1.02	Positive
-----------------	------	------	----------

Source: Field Survey Data & SPSS Output, 2025

The results in Table 2 present respondents' views on the role of aerial surveillance technologies in enhancing school safety in public primary schools in Benue State. The mean scores for all items range from 2.55 to 2.99, indicating general agreement among respondents. The highest mean score of 2.99 suggests that drone-based observation is highly effective in enabling early identification of security threats. The lowest mean score of 2.55 still indicates agreement that aerial surveillance improves wide area monitoring of school surroundings. Other items also show agreement that aerial systems support rapid emergency response, reduce blind spots in security coverage, and strengthen overall safety management in schools. The cluster mean of 2.77 with a standard deviation of 1.02 confirms a positive perception of aerial surveillance technologies. This means respondents recognize that aerial intelligence contributes meaningfully to improving surveillance coverage, threat detection, and safety administration in public primary schools.

Discussion of Findings

The findings show that tracking devices contribute positively to intelligence gathering that minimizes crime activities in public primary schools in Benue State. Respondents agreed that tracking systems improve real time monitoring, support early detection of suspicious movements, prevent unauthorized access, strengthen coordination with security agencies, and reduce theft, vandalism, and intrusion. This aligns with the study of Katarapu, Reddy, and Rao (2023), which found that GPS and GSM tracking devices significantly reduced kidnapping risks and unauthorized entry while providing useful intelligence for crime prevention. It also supports TAL Global (2026), which reported that digital monitoring systems offer early warning signals that enable proactive intervention before threats escalate. Similarly, Kritz (2024) confirmed that signal-based intelligence improves communication and response between institutions and security agencies, leading to faster neutralization of threats. In contrast, the results differ from studies that focus only on general technology use without linking it specifically to real time intelligence generation, as seen in Gbesoevi, Ola, and Simeom (2022), where emphasis was placed more on security planning and institutional management rather than direct tracking-based intelligence outcomes.

The findings also reveal that aerial surveillance technologies play a significant role in enhancing the safety of public primary schools in Benue State. It was found that drone-based observation improves wide area monitoring, enhances early threat detection, supports rapid emergency response, reduces blind spots in security coverage, and strengthens overall safety management. These results are consistent with Duff (2025), who found that drone surveillance improves visibility, reduces monitoring gaps, and enhances coordination with law enforcement agencies in educational environments. The findings also align with Aballe et al. (2022), who reported that CCTV based surveillance systems are highly effective in crime prevention through continuous monitoring and investigative support, showing that visual surveillance technologies consistently strengthen school security. Furthermore, the results support Gbesoevi, Ola, and Simeom (2022), who established that modern technological tools are significantly associated with improved school

safety and effective management outcomes. However, while previous studies such as Aballe et al. (2022) focused mainly on fixed surveillance systems like CCTV, the present findings extend this evidence by emphasizing mobile aerial surveillance systems, which provide broader coverage and more dynamic situational awareness for school administrators.

Conclusion

Based on the findings of this study, it can be concluded that information provided via tracking devices contributes significantly to gathering intelligence that minimizes crime activities in public primary schools in Benue State. It can be concluded that tracking based systems enhance real time monitoring, improve early detection of suspicious movements, strengthen coordination with security agencies, and reduce incidents of theft, vandalism, and unauthorized access in school environments. The study also concludes that aerial surveillance technologies play a vital role in enhancing the safety of public primary schools in Benue State. It can be concluded that drone and aerial monitoring systems improve wide area surveillance, support early identification of threats, reduce security blind spots, and strengthen emergency response and overall safety management in public primary schools.

Recommendations

1. Based on the finding that tracking devices contribute positively to intelligence gathering that minimizes crime activities in public primary schools in Benue State, the study recommends that education authorities and government agencies should adopt and integrate tracking technologies in public primary schools. School administrators should be trained on the use of these devices, while a structured coordination system should be established between schools and security agencies to ensure that data generated from tracking systems is used for real time monitoring, early threat detection, and prompt response to criminal activities.
2. Based on the finding that aerial surveillance technologies play a significant role in enhancing the safety of public primary schools in Benue State, the study recommends that government and school management boards should deploy aerial surveillance systems such as drones for routine monitoring of school environments and surrounding communities. Dedicated security units should be trained to operate these technologies, and their use should be integrated into school security policies to ensure continuous surveillance, early identification of threats, and rapid emergency response across public primary schools.
